

Project Portfolio — STAR Summaries by Amazon Leadership Principles

Introduction

This document compiles all self-initiated projects by Wonbin Shim, organized in the **STAR format** (Situation, Task, Action, Result) and categorized under Amazon's 16 Leadership Principles. Each project summary highlights the pain point addressed, the resolution delivered, cross-functional collaboration involved, blockers encountered, and workarounds implemented.

Customer Obsession

Projects that demonstrate relentless focus on delivering quality outcomes for end-users and platform safety.

1. Project Night-Fishing — BPO QA Rapid Response

Situation: Since the launch of KOM (Key Operations Metrics) within the Interactions moderation domain, quality progress remained steady but several key areas still fell short of targets. Moderation Consistency across Photo, Text, Messaging, and CGVR queues was underperforming benchmarks, with coaching interventions happening too slowly and inconsistently across BPO partner sites globally (APAC, EMEA, AMS). There was no standardized rapid-response mechanism to address daily quality deviations.

Task: Design and implement a proactive, rapid-response coaching program that combines targeted coaching with strengthened governance and monitoring to accelerate quality target achievement. The program needed to ensure that every identified diff case received coaching within a 24-hour SLA, with prioritization based on moderator quartile performance.

Action: I designed the "Night-Fishing" framework featuring a quartile-based coaching frequency model allocating 70% of daily coaching slots to Q4 (lowest performers), 20% to Q3, and tapering for upper quartiles. I created queue-specific prioritization logic triaging Photo Comments and Messaging as high-priority coaching queues. I built a coaching template and tracking system for BPO sites, established a daily reporting cadence to the Partner Success team, and mandated face-to-face coaching escalation for moderators with two consecutive weeks of errors. Cross-functional collaboration involved BPO QA teams, BPO operations, Partner Success POMs, and Evaluator teams across three regions. A key blocker was BPO capacity constraints — the

workaround was batching low-risk Q1/Q2 errors into weekly sessions to free capacity for high-priority interventions.

Result: Launched globally across APAC (April 2026), EMEA and AMS (April 2026), with enhanced APAC quartile framework from May 2026. The program cut unnecessary daily coaching volume for top performers while protecting the critical 24-hour turnaround for moderators who need it most, directly contributing to reduction in fuzzy cases and improved moderation consistency scores.

2. CGVR Tuition Program — Internal Planning & Process

Situation: CGVR (Community Guidelines Violation Rate) queues are high-risk moderation queues where violation consistency was below targets. Moderators assigned to CGVR queues lacked a structured tuition and calibration process, leading to inconsistent decision-making, high leakage rates, and repeated controllable errors across multiple markets (VN, US, JP, ID, MENA).

Task: Build a comprehensive CGVR tuition program that includes daily huddles, real-time Q&A channels, calibration loops, and a moderator go-live evaluation process to certify CGVR moderators and sustain high violation consistency.

Action: I designed a multi-layered tuition framework: 15-minute daily huddles led by Market BPO QA using evaluator feedback (10 cases/day); dedicated Lark communication channels for calibration and Q&A; a structured ticket system (KOM_Cal_Ticket) with 48-hour resolution SLA; and a moderator certification assessment process requiring 85% accuracy on 200 trial cases. I established collaboration between Evaluators, BPO QA, BPO TnQ/TL, and PS team across channels. A blocker was evaluator capacity for daily feedback — the workaround was having BPO TnQ teams lead daily huddles while evaluators prepared samples EOD and provided bi-weekly calibrations. I also coordinated market-by-market kickoff calls (VN, US, JP, ID, MENA) for phased rollout.

Result: The program established a target of $\geq 55\%$ overall violation consistency, ≤ 48 -hour ticket resolution, and $\geq 10\%$ week-over-week inconsistency reduction. The standardized process now runs daily across targeted markets with clear RACI ownership, enabling proactive quality improvement rather than reactive error correction.

3. DM-Messaging Quality Accuracy Special Forces (Walkie-Talkie)

Situation: DM-Messaging moderation quality was significantly below target, with moderation consistency at some sites as low as 55-65% against an 81% benchmark. 7 out of 13 sites were classified as P0 (top priority) with $\geq 8\%$ impact on overall accuracy. Multiple policy areas (Severe

Bullying, Moderate Bullying, Violent Behaviors, Sexual Content) showed recurring moderator errors.

Task: Lead an evergreen "Special Forces" program to boost low-performing language groups by 17-20% accuracy increment within a 2-month window (May-June 2026), achieving the 81% moderation consistency target by the final week.

Action: I structured the program with site prioritization (P0/P1/P2 based on impact), established mandatory action plans including 24-hour coaching and bottom quartile management for all underperforming sites. I designed weekly WBR (Weekly Business Review) meetings with a structured narrative format. I collaborated cross-functionally with Evaluators (market insight and RCA validation), BPO QA teams, and POMs across APAC, EMEA, and AMS regions. I integrated market-specific RCA analysis with evaluator support for JP, TR, VN, TH, and LATAM markets. A key blocker was the complexity of DM policy (sexual content routing between Adult/Youth categories) — the workaround was commissioning evaluators to create decision tree flowcharts for the four-policy cluster, projected to eliminate ~60% of wrong-label errors.

Result: Within the first two weeks, sites like TP-BOG showed 11.87% improvement and fuzzy cases reduced from 367 to 256 weekly. The program operates on a weekly cadence with real-time RCA tracking, market evaluator insights, and measurable coaching completion rates targeting full achievement of 81% consistency.

Ownership

Projects demonstrating end-to-end ownership, accountability, and going beyond role boundaries.

4. Project Step Up — Quartile Performance Management Framework

Situation: Performance management across BPO partner operations was fragmented, with disproportionate focus on bottom-quartile remediation only. There was no standardized framework for managing different performer tiers (Q1-Q4 and New Hires) across all partner sites. This inconsistency led to missed quality targets, unclear accountability, and inefficient resource allocation for coaching and performance improvement.

Task: Create a unified, standardized quartile management framework providing a clear step-by-step path for Bottom Quartile, Top Quartile, and New Hire moderators across all partner operations in APAC, EMEA, and AMS.

Action: I designed the complete framework including: performance segmentation using 4-week quality scores; a phased bottom quartile program (Phase 1: 4 weeks action plan, Phase 2: 2 weeks extended, Phase 3: removal from queue + 2 weeks intensive monitoring); top quartile

retention strategies (mentorship, rotational tasking, policy feedback roles); and a separate new hire management cluster with 8-week nesting + 2 weeks intensive care. I created graduation criteria measuring Consistency, Volume, and Autonomy. I built centralized tracking templates for monthly quartile progress, weekly accuracy monitoring, and action implementation. Cross-functional collaboration involved Partner Success POMs across three regions, Evaluator teams, BPO operations leadership, and HR teams. A critical blocker was stakeholder concern about high turnover from aggressive bottom quartile management — the workaround was building an 8-week total duration before endorsement decisions, including a "golden case queue" concept for Phase 3 moderators.

Result: Launched Phase 1 (Interaction projects) on May 4, 2026, and Phase 2 (Search, YML & TE) on May 11, 2026. The framework now provides uniform tracking cadence, enables early risk detection through weekly quartile monitoring, and connects operational actions directly to measurable accuracy improvement outcomes.

5. APAC Live Ops BCP Framework

Situation: The APAC Live Ops environment lacked a comprehensive Business Continuity Plan following the Atlas transition, which restructured markets into individual domains and eliminated direct sister-site backups. During unexpected disruptions (natural disasters, system outages, planned maintenance), there was no standardized process for volume management, causing risks to platform user safety, TikTok brand reputation, and regulatory compliance.

Task: Develop and implement a signed-off BCP framework for APAC Live Ops that addresses post-Atlas complexities including queue mapping, risk assessment, escalation procedures, and POM cadence requirements.

Action: I led the creation of the comprehensive BCP framework including: risk assessment matrices (volume downgrade, transfer, latency leniency, backlog abandonment, inflow pause); queue mapping with sister-site matching by policy region and language; high-risk event detection per APAC site; POM governance and execution cadence (quarterly HC/queue mapping updates, escalation procedures); and detailed information requirements from PPMs (local BCP, SOW clauses, GT/GA handling during BCP). I coordinated cross-functionally with Workflow Management, In-House Operations, OCC (Operations Command Center), PSA leads, and BPO local IT teams. A blocker was the absence of BCP cost clauses in existing SOW agreements with partners — the workaround was establishing that BCP costs remain non-billable and BCP drills are not encouraged since drill status is not billable.

Result: The framework was signed off by the full BCP Core Group including PPM Lead, PPMs, POMs, PSA Lead, and WM teams. It provides a comprehensive queue mapping masterfile, BCP checklist, manual, and detection system that all POMs reference during disruptions, ensuring continued platform safety operations.

6. Business Travel Application & Approval Process

Situation: There was no structured or standardized process for business travel planning, budget approval, and execution within the APAC Live Partner Success team. Travel decisions were ad-hoc, budget tracking was inconsistent, and there was no clear accountability chain for trip approvals, leading to budget overruns and misaligned travel agendas.

Task: Design a transparent, accountable business travel approval process that aligns travel strategy with program management goals, ensures budget discipline, and provides clear RACI ownership.

Action: I created an end-to-end process covering: Quarterly program planning (PPM creates partner program with high-level agendas and budget requests); PSA quality agenda alignment (identifying focus markets based on quality performance); travel strategy creation (collaborative between POM and PSA); budget proposal with 20% buffer for ad-hoc trips; and Department Lead approval gate. I developed RACI tables mapping responsibilities across PPM, POM, PSA Lead, PSA, and Live Department Lead for each task type. I created template documents for travel strategy and program planning. Cross-functional collaboration involved PPMs, PSA leads, POMs, PSAs, and the Department Lead. A blocker was balancing structured process with flexibility for urgent travel needs — the workaround was the 20% budget buffer allocation.

Result: The process was signed off by all PS leaders and provides a quarterly cadence that aligns travel with strategic partnership goals, ensures proper budget governance, and eliminates unauthorized or duplicative trips.

Invent and Simplify

Projects that demonstrate innovation, creative problem-solving, and process simplification.

7. AI-Powered Global Slang Curator — Real-Time Context Intelligence

Situation: Content moderation faced a critical "Context Gap." Bad actors constantly evolved language (algospeak, localized slurs, dog whistles) to evade standard blocklists. New hate speech or drug terminology spread on platforms weeks before official policy guidelines were updated. Moderators wasted valuable AHT (Average Handle Time) researching unfamiliar terms through Q&A or FBL channels, causing delays and potential leakages under AHT pressure.

Task: Build a Real-Time Context Intelligence Agent that empowers Content Moderators and Policy Teams to instantly decode obscure slang and cultural nuances, acting as a Force Multiplier for Trust & Safety operations.

Action: I conceptualized and prototyped the AI-Powered Global Slang Curator featuring: a "Scout Agent" that proactively monitors high-risk communities for surging terms; a geo-specific context engine providing risk scores, definitions, and policy categories; and a "Sidebar Assistant" integrated into moderator workflow for instant lookups. I built a working web prototype (deployed on GitHub Pages) demonstrating the concept. I designed the enterprise implementation roadmap covering infrastructure/security requirements, data/storage needs, and workflow integration specifications. The project required collaboration with potential stakeholders in T&S Engineering, Policy teams, and Platform Security. A key blocker was lack of internal engineering resources for enterprise deployment — the workaround was building the lightweight prototype to demonstrate immediate value and building a comprehensive technical specification to facilitate future resourcing decisions.

Result: Successfully delivered a working proof of concept with a clear enterprise roadmap. The system addresses three core pain points: closing "Policy Lag" through zero-day slur detection, reducing false positives/negatives through context awareness, and reducing cognitive load for moderators through instant risk scoring.

8. AI LLM Quality Management — Simplified Readiness Assessment

Situation: Quality management processes across TnS operations were heavily manual: coaching logs, calibration data, market alignment data, RCA tagging, and training needs analysis all relied on spreadsheets and manual workflows. There was no unified data platform, and the quality process pipeline (RCA → Coaching → Training → Reporting) was disconnected, preventing data-driven continuous improvement at scale.

Task: Design a comprehensive AI/LLM-powered quality management architecture that automates the end-to-end quality pipeline, and create a readiness assessment identifying what can be self-driven versus what requires engineering support.

Action: I mapped the complete quality management pipeline into a 5-stage architecture: Rock Platform (Quality Hub) → AI-Powered TNA → Automated Training Material Creation → LLM-Powered RCA Auto-Tagging → End-to-End Reporting with closed-loop feedback. I created a detailed readiness assessment categorizing 10 workstreams by status and progression ownership (Self-Driven by TnS Ops / Light Tech Support / Engineering Required). I mapped internal tools (Rock Platform, Aeolus, Magibook, Aime, Tika, Lark) to their enabling capabilities. Cross-functional collaboration involved TnS Ops, Platform teams, BPO partners (ACN-KUL already implementing base automation), compliance teams, and ML engineering. A blocker was the lack of centralized quality data storage — the workaround was leveraging Lark Sheet and Lark Base as interim databases while designing the full platform architecture.

Result: Delivered a comprehensive system architecture overview and staged implementation roadmap, with clear ownership mapping. ACN-KUL BPO already successfully implemented

"base automation workflow" as proof of concept. The document serves as the strategic blueprint for transforming manual quality operations into an AI-assisted, automated pipeline.

Hire and Develop the Best

Projects focused on developing talent, creating learning programs, and building team capabilities.

9. New POM Onboarding Program

Situation: When new Partner Operations Managers (POMs) joined the APAC Live Partner Success team, there was no formalized, structured onboarding program. New POMs had to rely on informal knowledge transfer, resulting in inconsistent readiness levels, extended time-to-productivity, and gaps in understanding partnership management, product knowledge, and site operations.

Task: Create a comprehensive, structured onboarding program that ensures every new POM can understand partnership management requirements, learn product and partner-specific insights, and demonstrate critical POM capabilities by the end of their training period.

Action: I designed a 5-stage onboarding journey: Stage 1 — ByteDance Corporate Onboarding (5 days); Stage 2 — TnS Policy Training by Global Trainer Team (16 days); Stage 3 — PS Functional Training by tenure POMs on metrics, site management, and partnership management (5 days); Stage 4 — Shadowing sessions with experienced POMs (3-5 days); Stage 5 — Site Visit for on-the-job training (5 days). I created material links, POC assignments, templates (travel strategy, FGD, debrief, site visit report), and a learning tracker template. Cross-functional collaboration involved HROEEE, Global Training team, existing POMs/PPMs, Admin, and IT. A blocker was coordinating schedules across multiple internal teams and training availability — the workaround was creating flexible timeline templates with clear POC designations for each stage.

Result: The program was signed off by the Department Lead and PPMs. It provides a repeatable, structured learning journey with clear milestones and materials, reducing POM ramp-up time and ensuring consistent capability development across all new hires.

10. New PSA Onboarding Program

Situation: Similar to POMs, new Partner Success Analysts (PSAs) joining the team lacked a formal onboarding plan, leading to inconsistent integration into the PS operating model. PSAs needed different competencies focused on data analysis, quality performance monitoring, and cross-functional coordination with Ground Truth teams.

Task: Create a formal onboarding plan for PSAs that inculcates best practices, integrates them into the PS operating model, and sets them up for success in their analytical and operational roles.

Action: I adapted the POM onboarding framework for PSA-specific needs: same 5-stage structure but tailored content (shadowing with XFNs including Ground Truth team, PSA-specific functional training). I created a dedicated RACI matrix for PSA onboarding with clear responsibilities across HRBP, PSA Lead, PPM, Onboarding POC, and Training teams. I included Atlas training specifications for different queues and self-learning courses for markets not yet on Atlas. Cross-functional collaboration involved HRBP, APAC Training team, Ground Truth team, existing PS members, and BPO POMs. A blocker was that some training queues were still transitioning to Atlas — the workaround was maintaining parallel self-learning courses until full Atlas migration was complete.

Result: The program provides a structured integration path specific to PSA roles, with clear accountability through RACI, sign-off from Department Lead and PPMs, and a repeatable framework for onboarding all future PSA hires.

11. PS Learning & Growth (L&G) Squad

Situation: Team survey results revealed strong willingness among PS team members to attend L&D courses for skill development, but the second-highest roadblock was "Couldn't see any interesting L&D courses." The team expressed interest in project management, soft skills/communication, language/culture understanding, and data analysis/dashboard skills, yet no structured program existed to address these needs.

Task: Establish a Learning & Growth squad that designs, organizes, and delivers relevant learning content across multiple skill domains, driven by team demand analysis and peer-led knowledge sharing.

Action: I co-led the formation of the L&G squad with designated core members and group divisions: L&G Demand Analysis, Project Management, Soft Skills/Communication, Language & Culture, and Data Analysis. I established quarterly demand surveys and monthly satisfaction surveys as feedback loops. I organized content from ByteLearning platform and curated external free resources (King Sejong Institute for Korean, NHK for Japanese). I set cadence requirements (monthly content sharing, quarterly knowledge sharing sessions). Cross-functional collaboration involved HRBP, PPMs, POMs from all PS teams, and the ByteLearning platform. A blocker was sustaining engagement beyond initial enthusiasm — the workaround was making all core members (including PPMs) mandatory participants in Project Management courses, creating accountability.

Result: The L&G squad is operational with 5 group divisions, clear leadership assignments, quarterly timeline commitments, and multiple active learning tracks. The Dashboard Creation

knowledge sharing course (driven by L&G squad) directly led to BPO-facing dashboards being created for partner sites.

12. Two-Phase Refresher Program — Global Best Practice

Situation: Moderation quality data showed that Severe Bullying was the top error driver causing moderation consistency and violation consistency declines. Moderators consistently mis-tagged cases involving sexual intention interpretation and target identification. Traditional one-off training sessions were insufficient to address deeply embedded knowledge gaps and behavioral errors across multiple BPO sites.

Task: Design a scalable, data-driven two-phase refresher program that identifies specific policy knowledge gaps, delivers targeted training, measures improvement, and can be rolled out globally as a best practice.

Action: I designed the program with: Phase 1 (Self-Learning) — 30-minute online module + knowledge-check test (50 cases) based on evaluator-shared recordings; Phase 2 (Trainer-Led) — live 1-hour sessions focused on site-specific top error patterns identified through data scrubbing (not generic training). I created the Training Needs Analysis (TnA) methodology using multi-dimensional bifurcation (by moderator, by frequency, by sub-policy granularity). I designed the FBL (Feedback Loop) redesign to add sub-policy categorization for precision training. I incorporated a post-training assessment (10 cases, 90% pass rate) with coaching for failures. Cross-functional collaboration involved BPO TnQ teams (material preparation), Evaluators (refresher content, calibration support), and PS teams (oversight). A blocker was BPO TnQ teams' initial unfamiliarity with data-driven TnA — the workaround was providing detailed tracker templates and demonstrating the GI-HAN best practice as a reference model.

Result: The program is deployed as a global best practice guide, with measurable pre/post training metrics comparison. The TnA methodology enables targeted interventions rather than generic retraining, and the FBL redesign moves from generic feedback to precision sub-policy scenarios — enabling quantitative heatmaps showing which sub-policy elements are failing.

Insist on the Highest Standards

Projects that establish, raise, and maintain quality standards across operations.

13. S&IS Quality Process Standardization

Situation: Search and Interaction Safety (S&IS) quality processes varied significantly across BPO sites. There was no unified definition of controllable vs. uncontrollable errors, no standardized

calibration submission format, and inconsistent post-calibration cascading practices. Some BPO sites submitted poorly formatted FBL questions lacking policy rationale, delaying evaluator support and leaving moderators without timely guidance.

Task: Standardize the end-to-end quality process covering error classification, pre-calibration procedures, Q&A/FBL submission formats, and post-calibration information cascading across all S&IS queues (SCL, SUG, Interaction).

Action: I created comprehensive standardized definitions for controllable/uncontrollable errors across SCL, SUG, and Interaction queues with clear ownership (Ops team for blatant errors, Quality team for interpretation errors, Training team for knowledge gaps). I designed pre-calibration requirements (OH-moderator sessions, mitigation plans while awaiting evaluator support, daily briefings/huddles). I established the FBL submission format standard (Content Summary, Applied Policy, Tagging Logic, Question) with good/bad examples. I created post-calibration requirements including mandatory face-to-face cascading and knowledge checks (Juren Test or Quick Quiz options). Cross-functional collaboration involved BPO QAs, BPO Trainers, Evaluators, PS teams, and Operations TLs. A blocker was inconsistent interpretations of "controllable" across sites — the workaround was creating detailed lookup tables with specific scenarios for each queue type.

Result: The standardized process provides three options for post-calibration verification (formal flowchart-based, Quick Quiz automation, or moderator calibration + variance analysis) with clear implementation guidance, enabling sites to choose based on their operational capacity while maintaining consistent quality standards.

14. CGVR Tuition Process — BPO-Friendly Version

Situation: The CGVR moderation queue required specialized policy understanding, but BPO teams lacked a clear, structured reference framework for handling CGVR cases. Policy ambiguities, interpretation gaps, and inconsistent escalation pathways resulted in repeat errors and poor decision quality in these high-stakes queues.

Task: Create a standardized, BPO-friendly CGVR tuition process document that serves as the operational reference for QA, Moderators, and stakeholders to address ambiguities, reduce gaps, and improve decision quality.

Action: I structured the process into three pillars: Daily Huddle Process (purpose, ownership/roles, frequency, BPO requirements including key focus announcement, feedback sharing, rapid interaction checks); Daily Q&A Process (real-time policy clarification through dedicated Lark working group with structured submission templates); and Operating Rules (question must include case context + moderator rationale + confusion point; evaluator responds with correct decision + policy rationale + common misinterpretation tips + gap classification). I designed clear RACI tables for each process and Q&A format specifications.

Cross-functional collaboration involved ByteDance Evaluators, BPO TnQ/TL, BPO Moderators, and PS team. A blocker was maintaining evaluator responsiveness in real-time Q&A given their workload — the workaround was designating BPO moderator support teams as the first filter before escalating to evaluators.

Result: The process serves as the published operational SOP for all CGVR BPO teams, establishing a daily feedback loop (Evaluator → BPO TnQ/TL → Moderators), enabling real-time policy clarification, and consolidating high-frequency questions into next-day huddle materials for continuous learning.

Dive Deep

Projects demonstrating deep data analysis and root-cause investigation.

15. Cost-Volume Analysis — KR BPO Sites Q1 2023

Situation: During site visits to TC-SEL and TC-BUS in Korea, workload imbalances were observed: moderators idling while waiting for cases, high utilization rates (UR) from excessive volume with insufficient headcount, and high UR despite balanced productivity. ByteDance was paying BPO based on attendance hours but had no visibility into whether the forecasted volume, actual inflow, and BPO productivity were aligned, raising questions about overpayment or underpayment.

Task: Conduct a comprehensive cost-volume analysis mapping all permutations of forecast vs. actual inflow vs. output across KR BPO sites (TC-SEL, TC-BUS) to identify misalignments, determine cost impact, and propose actionable recommendations to stakeholders (Capacity Planning, Workflow, Budget & Workforce).

Action: I designed a systematic analytical framework examining: all scenario permutations of forecasted volume vs. actual inflow vs. actual output; identification of latency, UR, and cost impacts per scenario; and application of the framework to actual site data across 5 LOBs (TTR1, TTR2, LIVER1-Gaming, LIVER1, LIVER2, LIVER3). I discovered a 200%+ gap between forecasted and actual volumes in TTR1, 400%+ overforecasting in LIVER1-Gaming, and questionable UR calculations in LIVER2/LIVER3. I formulated SMART recommendations for each LOB targeting $\pm 10\%$ forecast accuracy. Cross-functional collaboration involved Capacity Planning, Workflow, Budget & Workforce, Metrics Operations, Business Excellence, and BPO management. A blocker was that DP (Data Power) UR calculations appeared unreliable when cross-referenced with site observations — the workaround was on-site interviews with moderators to validate actual workload conditions before drawing conclusions.

Result: Identified concrete cost-saving opportunities including potential 80% HC reduction for LIVER1-Gaming due to overforecasting, proposed forecast-volume split between TC-BUS and TC-

SEL for visibility, and surfaced a systemic UR calculation accuracy issue that MO needs to resolve. All recommendations were presented with target implementation within 5-6 bi-month cycles.

Earn Trust

Projects that build trust through transparency, clear role definition, and collaborative frameworks.

16. APAC Search Ops RACI & R&R

Situation: The APAC Search Ops data delivery teams, Project POCs, and GPMs lacked regional alignment on roles and responsibilities. This gap created confusion about accountability, duplicative efforts, and delayed project execution. Without clear expectations for each role, process gaps persisted and escalation paths were unclear.

Task: Create a regionally aligned RACI table and task-based R&R (Roles & Responsibilities) document that reduces process gaps, sets clear expectations, and establishes accountability for all Search Ops project activities.

Action: I co-authored the first version of the Search Ops RACI/R&R document, designing comprehensive RACI tables covering all activities and categories within Search Ops data delivery. I complemented the RACI with a detailed task-based R&R table providing granular explanations for each role's expected responsibilities. I secured sign-off from seven senior stakeholders spanning multiple functions to ensure broad alignment. Cross-functional collaboration involved Search Ops data delivery teams, Project POCs, GPMs, PSA leads, and Department leads. A blocker was getting consensus among diverse stakeholders with different interpretations of role boundaries — the workaround was iterative draft reviews and incorporating feedback from all signatories before final publication.

Result: The document was signed off by all relevant stakeholders and serves as the regional reference for Search Ops process clarity. It reduced ambiguity in role boundaries, accelerated decision-making by establishing clear escalation paths, and set the foundation for consistent project delivery across APAC.

17. Dashboard Creation Knowledge Sharing — Project Proposal

Situation: The APAC Live PS team lacked a centralized system for accessing holistic data and performance metrics. POMs relied on ad-hoc data requests, resulting in inefficiencies, delayed decision-making, and inability to share meaningful performance dashboards with BPO partners.

Team members did not have the technical skills to create their own dashboards using Data Power.

Task: Design and execute a dashboard creation training program that empowers all PS team members to independently create data dashboards, fostering a culture of data-driven decision-making and improving efficiency in workload management.

Action: I proposed and managed the project with volunteer trainers from the POM team who prepared training content. The program was structured in 3 training groups across May, with hands-on exercises and partner dashboard creation as the final deliverable. I designed the post-training pathway: survey to identify interested POCs → dashboard creation kickoff → sign-off from Department Lead → sharing with partner sites. I established a Live PS Dashboard repository and secured Data access alignment with BEx team. Cross-functional collaboration involved volunteer POM trainers, BEx (data access), Department Lead (sign-off), and BPO partner sites (end users). A blocker was varying technical skill levels among participants — the workaround was grouping sessions across dates and providing follow-up support POC assignments per BPO partner.

Result: All three training sessions completed, with GI dashboard already built by a POM. Each major BPO partner (Transcosmos, Accenture, Majorel, Teleperformance, Alorica, Concentrix) has an assigned support POC and responsible person for dashboard creation, establishing a sustainable model for data self-service across the team.

Learn and Be Curious

Complementary to the L&G Squad and Dashboard project above, these demonstrate continuous learning culture.

Think Big & Bias for Action

The AI-Powered Global Slang Curator and AI LLM Quality Management projects (covered under "Invent and Simplify") also exemplify **Think Big** by envisioning platform-scale AI transformation, and **Bias for Action** through building working prototypes before seeking full engineering support.

Frugality

The Cost-Volume Analysis (covered under "Dive Deep") directly demonstrates **Frugality** by identifying overforecasting that led to overpayment of BPO partners and proposing HC reductions to align spending with actual operational needs.

Have Backbone; Disagree and Commit

The Cost-Volume Analysis also demonstrates this principle — challenging Capacity Planning, Workflow, and Budget & Workforce teams with data-backed evidence of 200-400% forecast-actual gaps, and proposing concrete headcount reductions despite organizational resistance to change.

Deliver Results

All projects above demonstrate delivery of measurable results. The most results-focused are:

- **Project Night-Fishing:** Measurable weekly coaching completion rates and fuzzy case reduction
 - **DM-Messaging Special Forces:** Site-level accuracy improvements tracked weekly
 - **Project Step Up:** Quartile movement from bottom to top as key success metric
 - **Cost-Volume Analysis:** Concrete cost-saving recommendations with implementation timelines
-

Success and Scale Bring Broad Responsibility

The **BCP Framework** and **AI LLM Quality Management** projects demonstrate responsibility at scale — ensuring platform safety during disruptions across the entire APAC region, and designing quality systems that serve not just one team but the entire Trust & Safety operation.
